High-Tech, High-Touch, High Performance.

Honeywell Customer Experience Center
Game-changing Technologies That Ensure Safe, Reliable and Efficient Operations

Immersive Experience

Fifty years ago Honeywell Process Solutions introduced the world’s first Distributed Control System, and it forever changed process automation. That kind of revolutionary innovation is ingrained in our culture. Today, more than 5,000 Honeywell engineers design and develop new technologies across the supply chain—from field to boardroom. Process facilities across all industries and across the world choose Honeywell to ensure safe, more reliable, efficient, productive and profitable operations.

The Customer Experience Center offers the ability to see, touch and experience the full range of Honeywell’s automation products and services. And it provides access to the tools and experts that can help solve the most pressing issues.
Customers Partner with Honeywell Because We Deliver Results:

From New Projects to Lifecycle Solutions—Experience It All

Experion® PKS Orion—An Unprecedented User Experience

At the heart of the Honeywell Customer Experience Center is the Experion® PKS Orion Operations Center. With its enhanced situational awareness, an operator can work smarter, respond faster and run a process closer to its limits for greater profitability. With this single operations center, customers monitor and interact with process equipment thousands of kilometers away, allowing the ability to centralize operations and expertise.
Smart and Connected Field
Plant reliability depends on optimum management of instruments, valves, and complex equipment like compressors, pumps, and heat exchangers. Our precise portfolio of measurement and control devices deliver industry-leading performance, lowest total cost of ownership and are fully integrated with Experion PKS.

Integrated Safety and Security
Safety and security are two pillars that serve as the foundation for industrial processes. Honeywell offers a comprehensive and integrated approach to safety and security to ensure compliance while protecting people and plant assets. Our solutions for safety, alarm management, fire and gas, cyber security, perimeter surveillance and access control provide multiple layers of defense.

Intelligent Data for Operational and Business Excellence
Industrial operations are literally drowning in terabytes of data across widely distributed and disparate assets. Honeywell’s broad suite of advanced software solutions helps make sense of data, turning it into meaningful and actionable information that ensures optimum performance. Our portfolio features process design, history and analytics, as well as software for operator competency, enterprise collaboration, production management, asset management and industry specific applications. We provide visibility for better decisions and profitability.
Transformed Project Execution

Predictability in today’s capital-intensive markets is a challenge. Project cost overruns and delays contribute greatly to this dynamic. With LEAP™, Honeywell has revolutionized project execution with parallel engineering and standardized cabinet design. We’ve enhanced our project implementation services with Virtualization, Universal Channel Technology and Cloud Engineering to reduce project risk, improve project scheduling flexibility by 25% and save up to 30% on automation expenditures.

Lifecycle Investment Protection

Honeywell is committed to delivering the longest lifecycle in the market while reducing total cost of ownership. Our continuous evolution approach to migration eliminates costly rip and replace, allowing gradual migration of systems and software. Customers around the world are able to enhance performance by leveraging the latest functionality while protecting their intellectual property. We offer global expertise with local support, engaging in several modes of service, including replacement parts and on-demand services, projects and service contracts.
