Wireless Differential Pressure Transmitter
Versions 1.70 or later

Important Information to the User

- Changes or modifications not expressly approved by the manufacturer may void the user's authority to operate the equipment.

- This device is for mobile and fixed use only (not portable or body-worn). A separation distance of 20cm must be maintained at all times between the antenna and the body of the user and bodies of nearby persons.

- This device has been designed to operate with an antenna having a maximum gain of 9 dBi. Antenna having a higher gain is strictly prohibited per regulations of Industry Canada. The required antenna impedance is 50 ohms.

- To reduce potential radio interference to other users, the antenna type and its gain should be so chosen that the equivalent isotropically radiated power (EIRP) is not more than that required for successful communication.

- The antenna is factory installed and MUST NOT be removed or modified by user.

Introduction

1.1: USING THIS MANUAL

This manual is designed to assist in installing, operating, and maintaining the following Differential Pressure Transmitters Models WD620, WD622, WD624. The manual is broken into sections as follows:

Section 2: Quick Start
This section summarizes what must be done in order to get the device installed, configured and in operation quickly. However, it does not provide detailed or how-to information to perform the tasks outlined.

Section 3: Installation
This section covers general considerations regarding correctly commissioning the Transmitter as well as unique applications such as flow service commissioning. Also covered in this section are mechanical installation considerations; such as Transmitter placement.

Section 4: General Configuration
In this section general configuration options such as password protection, and selecting a user password are discussed. Also covered is the setting of a Transmitter tag name, resetting of all Transmitter settings, and a discussion of the various messages that are displayed on the Transmitter LCD.

Section 5: Configuring the RF Communications
This section covers the setup of the Transmitter RF Communications which allow the Transmitter to achieve communication with the Base Radio. Parameters discussed are the Transmitter RF ID, the RF channel setting and Baud Rate.

Section 6: Configuring the Sampling and Transmission Rates
This section aids the user in selecting the amount of time between each sample of the process, and the time between each transmission of this sample to the Base Radio. Also discussed is the use of setting an abnormal threshold in which sampling and transmission times may change during a period when the process variable is within the abnormal region.

Section 7: Configuring the Process Variable
This section helps the user to zero the sensor, as well as discussing the setting of a measurement offset and trimming the process measurement.

Section 8: Selecting and Configuring Operation Modes
In this section the four operation modes (pressure, orifice flow, open channel flow, and level) of the Differential Pressure Transmitter are discussed in order to aid the user in selecting the right mode for his or her application and properly configuring the Transmitter for that specific application.

Section 9: Maintaining the Transmitter
This section explains how the Transmitter should be cared for once it has been placed into service and how to change the battery.

Section 10: Technical Specifications
This section explains the technical specifications that are associated with this device such as power characteristics, accuracy, and operating characteristics.
1.2: ABOUT THE DEVICE

The Honeywell Differential Pressure Transmitter is a reliable Radio Frequency (RF) transceiver coupled with a differential pressure sensor that can be used to monitor a variety of processes in hazardous and hard-to-reach areas. The time and expense of running wires often makes it difficult to measure parameters that have an economic impact on your plant operation, but the Differential Pressure Transmitter allows you to quickly and accurately monitor those devices at a fraction of the cost, which gives you bigger and faster returns on your instrumentation investments.

The Transmitters communicate in a secure, digital protocol over a band of frequencies from 869.4 MHz to 869.65 MHz. This data communication technique has been the backbone of the military’s secure communications protocols for many years. These devices require no wires, permits or licenses, and they are easily set up and installed right out of the box.

You can use this device for long term monitoring in remote locations, for short-term data gathering on process conditions, or to quickly test the economic viability of a new installation.

The purpose of this manual is to help you install and maintain your Honeywell Differential Pressure Transmitter. BEFORE setting up and installing the Transmitter please setup and configure the Base Radio.

1.3: CE CONFORMITY

These models are in conformity with the protection requirements of European Council Directives: 89/336/EEC, the EMC Directive, Generic Immunity Standard for industrial environments, and 1999/5/EC, the Telecommunications Directive in accordance with EN 300 220-3-2000 – Electromagnetic compatibility and Radio spectrum Matters (ERM); Short Range Devices SRD); Radio equipment to be used in the 25 MHz to 1 000 MHz frequency range with power levels ranging up to 500 W; Part 3: Harmonized EN covering essential requirements under article 3.2 of the R&TTE Directive, EN 300 489-1-2005 – Electromagnetic compatibility and Radio spectrum Matters (ERM); Electro Magnetic Compatibility (EMC) standard for radio equipment and services; Part 1: Common technical requirements, EN 300 489-3-2002 – Electromagnetic compatibility and Radio spectrum Matters (ERM); Electromagnetic Compatibility (EMC) standard for radio equipment and services; Part 3: Specific conditions for Short-Range Devices (SRD) operating on frequencies between 9 kHz and 40 GHz, and EN 61326-1997+A1+A2, Electrical Equipment for Measurement, Control and Laboratory Use – EMC Requirements. Conformity of this product with any other “CE Mark” Directive(s) shall not be assumed.
1.4: UNPACKING

Remove the Packing List and check off the actual equipment received. If you have any questions about your shipment, please call your Honeywell Representative. Upon receipt of the shipment, inspect the container for any signs of damage in transit. Especially take note of any evidence of rough handling. Report any apparent damage immediately to the shipping agent.

Please note that sometimes units are assembled with accessories when shipped. Inspect the shipment carefully if you think that something is missing. This is rare, as we take considerable care to pack units for shipment, but it does sometimes happen. Please give us a call and we may be able to resolve this matter quickly over the phone.

**NOTE**

The carrier will not honor any claims for damage unless all shipping materials are saved for their examination. If you find any damage while you are examining and removing the contents, save the packing material and the carton.

1.5: SOFTWARE COMPATIBILITY

Software for Honeywell is revised periodically. Internal device software may contain portions that are not compatible with previous versions of the Wireless Management Toolkit software.

To ensure software compatibility, Wireless Management Toolkit software version 1.70.138 or later must be used. If you believe you are experiencing software compatibility issues please call your local representative or email bill.europe@Honeywell.com.
Quick Start

This section summarizes what must be done in order to get the device installed, configured, and in operation quickly. However, it does not provide detailed or how-to information to perform the tasks outlined.

1. Install the Transmitter in the desired location of operation.
2. Turn on the Transmitter by simultaneously pressing and holding the ENTER and NEXT buttons until the unit powers up.
3. Hit the NEXT button until the CONFIG message appears then hit ENTER.
4. Enter the default password 0000 to enter the CONFIG menu.
5. Enter the SET RF menu.
6. Set RF CHAN setting equal to the Base Radio’s RF Channel.
7. Set BAUD RT setting equal to the Base Radio’s Baud Rate.
8. Set RF ID number to be a unique value between 1 and 42.
9. Select normal transmission rate.
10. Select normal sampling rate.
11. Select abnormal transmission rate.
12. Select abnormal sampling rate.
13. Set normal upper and lower values.
14. Select engineering measurement units.
15. Zero the sensor.
16. Trim and Offset the measurement (if appropriate).

If the “RF OFF” message is being displayed on the Transmitter LCD, perform the following:

- Set the RF CHAN setting equal to the Base Radio’s RF Channel.

If a “NO RF” message is being displayed on the Transmitter LCD, check the following:

- Is the Transmitter set to the above listed configurations?
- Is the Base Radio on?
- Do the Transmitter and Base Radio settings match? (See Section 5 of the Transmitter and Base Radio User Manuals)
- Are the Base Radio and Transmitters unable to communicate due to obstructions or distance? (See Transmitter Manual: Transmitter Placement section).
- Have you run the RSSI Diagnostics? (See Section 3.2.1 Transmitter RSSI Diagnostic)
In this section, mechanical installation instructions are discussed for the various setup capabilities of the Differential Pressure Transmitter. The subsections are as follows:

3.1.1: Special Conditions for Safe Use (Hazardous locations)
3.1.2: Transmitter Positioning
3.1.3: Installation in Liquid Flow Service
3.1.4: Installation in Gas Service
3.1.5: Installation in Steam Service

Each Honeywell Differential Pressure Transmitter is a rugged device which provides optimal performance when installed with careful consideration. It may be utilized in any ultrasound measurement service so long as care is exercised to prevent exposing the sensing elements to excess stress or temperature. Installation practices greatly affect the life that you can expect from your Honeywell Differential Pressure Transmitter.

Give careful consideration to the environment where you will be installing your instrument. Avoid installations that expose the device to excess temperature, high vibration, considerable shock, or exposure to dripping condensate or corrosive materials. Also avoid installing the device in an unserviceable location.

Most often these problems can be avoided with some thought at the time of installation. The practices noted below are generally recommended, but they can only act as a guideline and cannot cover all possible variations. The final installation must be made at your discretion and approval. You must be the judge of the actual installation.

Dimensioned mechanical drawings for aid in mechanical installation are located in Section 10: Technical Specifications.

Parts of the enclosure are non-conducting and may generate an ignition-capable level of electrostatic charge under certain extreme conditions. The user should ensure that the equipment is not installed or used in a location where it may be subjected to external conditions (such as high-pressure steam) which might cause a build-up of electrostatic charge on non-conducting surfaces. Additionally, the equipment must be cleaned only with a damp cloth.

As aluminum may be used at the accessible surface of this equipment, in the event of rare incidents, ignition sources due to impact and friction sparks could occur. This shall be considered when the Honeywell XYR-5000 series Transmitters are being installed in locations that specifically require group II, category 1G equipment.
3.1.2: Transmitter Positioning

Correct positioning of the Transmitter will ensure the best performance of the device. When planning the positioning of the Transmitters there are a few parameters that must be paid attention to:

- The top of the Transmitter should point upwards. The bottom of the Transmitter should NOT point directly at the Base Radio and the Transmitter LCD should point away from the Base Radio.
- All Transmitters should maintain an approximate spacing of at least six feet apart from one another.
- The line of sight range between a Transmitter and Base Radio is 600 m (2000 ft). Note that this range is reduced by the amount of RF noise present, obstructions, and the material properties of the obstruction.
- Only place the Transmitter in ambient operating temperatures of -40°F to 185°F (-40°C to 85°C).

Figure 3.1 gives examples of incorrect setups according to the previously mentioned parameters.

![Figure 3.1: Examples of Incorrect Transmitter Positioning](image-url)
Because there are so many setup possibilities we cannot cover them all. A correct setup would make sure that the above warnings are heeded, and that the Transmitter and Base Radio are capable of communication. The Testing Communications section will help you to determine if you have selected the correct installation points and orientations for your application.

3.1.1.1: Technique for Close Positioning of Transmitters

Transmitters may be placed closely together by carefully following this procedure. If this procedure is not followed, the communication range of the Transmitters will be significantly reduced and the Transmitters may eventually lose communication with the Base Radio entirely. This procedure is easy to implement, but please read carefully for a full understanding.

The Base Radio synchronizes with the Transmitters in Synch Groups of 7, organized by their RF ID numbers. If you want to place two Transmitters closer than 6 feet, make sure that you have set them in different groups. Note that this only applies to Transmitters that are communicating with the same Base Radio. The groups are defined in the following table:

<table>
<thead>
<tr>
<th>Group</th>
<th>RF ID Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1-7</td>
</tr>
<tr>
<td>2</td>
<td>8-14</td>
</tr>
<tr>
<td>3</td>
<td>15-21</td>
</tr>
<tr>
<td>4</td>
<td>22-28</td>
</tr>
<tr>
<td>5</td>
<td>29-35</td>
</tr>
<tr>
<td>6</td>
<td>36-42</td>
</tr>
</tbody>
</table>

For example, if two Transmitters are placed one foot apart and the first Transmitter has an RF ID number of 027, that means it is in the 4th group (22-28). The second Transmitter must have an RF ID number that is in another group (less than 22 or greater than 28). Setting the RF IDs of two closely spaced Transmitters so that the RF ID numbers are greater than 7 apart ensures that the Transmitters are in different Base Radio sync groups. This allows the closely spaced Transmitters to properly receive their synchronization signal from the Base Radio and maintain their proper communication and range.

You can also ensure that closely spaced Transmitters maintain their synchronization with their Base Radio by simply assigning each of the two closely spaced Transmitters to talk to a different Base Radio.

Either way, following this process will keep the Base Radio and Transmitters properly synchronized for long-term communication.
### 3.1.3: Installation in Liquid Flow Service

In liquid service, you want all of the impulse lines to be completely full of liquid. It is generally best practice to place the process taps in the side of the liquid process line. This minimizes the entrance of gas bubbles, which tend to form at the top of the process line. It also tends to minimize the entrance of sludge and particulates that tend to accumulate in the bottom of the line.

1. Tap into the side of the process line.
2. Mount the transmitter beside or below the taps.
3. Position the vents level with or above the point where the impulse lines connect to the transmitter. This will give the best way to vent all of the air out of the impulse lines and flanges.

### 3.1.4: Installation in Gas Service

Here you want the impulse lines and manifold to be full of gas. Placing the taps in the top of the line generally prevents liquid from entering the transmitter. Mounting the transmitter above the process piping allows any liquid or condensate that does form in the impulse lines to drain back into the process piping.

1. Tap into the top of the line
2. Mount the transmitter above the taps

### 3.1.5: Installation in Steam Service

Steam service is slightly more complex. Here, you want to tap into the side of the steam lines to keep from collecting sludge and particulates. Process steam temperatures almost always exceed the working temperatures for the differential pressure transmitter. To surmount this problem, allow the impulse lines to condense and cool the steam by exposing the impulse lines to the general ambient temperature. Make the vertical section of the impulse lines long enough to make sure the steam condenses in the impulse lines. A good rule of thumb is that each 30 cm of condensate line reduces the temperature by 10°C. Example: Saturated steam at 103 kPa is approximately 121°C. To lower the temperature at the transmitter to 93°C, take 28°C divided by 10°C per 30 cm = 840 cm of condensate piping. Drain valves on the vertical portion of the condensate lines are generally a good idea to help keep the system clean and free from a build-up of sludge.

1. Tap into the side of the steam line.
2. Run vertical impulse lines to allow the steam to condense and cool. Mount the transmitter below the line taps but above the drain valves.
3. Fill the impulse lines with water when commissioning the device.

---

**NOTE**

The piping between the process and the transmitter must accurately convey the process pressure to the transmitter sensor. In transferring the pressure, there are several sources of error. These are: leaks, pressure loss due to friction (particularly if purging is used in the application), gas that is trapped in a liquid line, liquid that is trapped in a gas line, temperature induced density variations between the legs, other density variations between the measurement legs. The actual installation must be made to minimize these errors.
3.2: Testing Communications

Remember, proper placement of the Transmitter will optimize your RF communication range and capabilities. Perhaps the best test to perform before mechanically mounting the unit is a quick hand-held test. There are two types of tests you can conduct: the RSSI (Received Signal Strength Indicator) Diagnostic and the Link Test. The RSSI Diagnostic measures the strength of the signal at the Transmitter. The Link Test measures the throughput of data sent to and from the Transmitter. The Link Test may be conducted from the Transmitter, Base Radio, or through WMT.

The RSSI Diagnostic should be conducted first to determine if the Base Radio is communicating with the Transmitter. Then the Link Test may be performed to test the validity of the installation.

To perform these tests you should have a good idea of where the Base Radio will be placed (for more information see Section 3 of the Base Radio User Manual). Place the Base Radio in the desired area and power on. Make sure that the Base Radio and Transmitter are on the same RF Channel and Baud Rate (See Section 5). You may also have to increment the number of Transmitters with which the Base Radio is communicating (See the Base Radio User Manual Section 4.3).

Once both the Base Radio and Transmitter are set up to be on the same network, make sure communication is established by looking at the Transmitter LCD for the ‘RF OK’ message in the Read-Only Sequence (see Section 4.1.1).

After communications have been established, go to Section 3.2.1 for the RSSI Diagnostic or Section 3.2.2 for the Link Test.

3.2.1: Transmitter RSSI Diagnostic

The Transmitter should be placed in RSSI Diagnostic mode to determine the signal strength at the location of the equipment to be monitored.

The RSSI Diagnostic, located in the Transmitter’s diagnostic menu, displays the RF signal strength in one of seven ranges. The signal strength is displayed on the LCD using a combination of ‘>’ and ‘_’ characters. Full signal strength is displayed as “>>>” while minimum signal strength is displayed as “_ _ _ _ _ _ _”. If the transmitter is not communicating with the Base Radio (i.e. NO RF), all underscore characters will be displayed (“_ _ _ _ _ _ _”).

The RSSI is measured every time the Transmitter receives a message from the Base Radio. The signal strength of the received message from the Base Radio is calculated during this time. The actual signal strength in dBm for each range is shown below:

<table>
<thead>
<tr>
<th>&gt;</th>
<th>&gt;</th>
<th>&gt;</th>
<th>&gt;</th>
<th>&gt;</th>
<th>&gt;</th>
<th>&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than</td>
<td>Between</td>
<td>Between</td>
<td>Between</td>
<td>Between</td>
<td>Between</td>
<td>Greater than</td>
</tr>
<tr>
<td>-105 dBm &amp; -100 dBm</td>
<td>-95 dBm &amp; -90 dBm</td>
<td>-85 dBm &amp; -80 dBm</td>
<td>-80 dBm</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

NOTE

The RSSI Diagnostic may only be conducted from Transmitters versions 1.56 and higher. The version number may only be checked when the Transmitter is powered up. See Figure 4.1.
3.2.1 Continued

To place the Transmitter in RSSI Diagnostic mode follow the menu map shown in Figure 3.4. Note that the RSSI menu is under the DIAGNSE menu and not the CONFIG menu.

![Figure 3.4: Menu Map to RSSI Mode](image)

Now that the Transmitter is in the RSSI mode, bring the Transmitter close to the equipment you wish to monitor. Look at the LCD; notice the ‘>’ will constantly fluctuate. You should estimate an average value based on these fluctuations. The ideal signal integrity is seven arrows.

Once you have verified that you are receiving a signal, you should check to make sure the Transmitter is communicating properly with the Base Radio. To do so exit the RSSI by pressing ENTER, and then navigate to the EXIT? of the diagnostic menu and return to the Operations Sequence shown in Figure 4.1 in Section 4.1.

If you see a NO RF message, then you do not have satisfactory RF communication with the Base Radio. If your application allows, move the Transmitter to a different position and check again for communications.

One final solution is to reposition the Base Radio. However, this may affect communications with previously installed Transmitters, and if so, may require the use of a second Base Radio for your application. To select a better spot for the Base Radio, see Section 3.1.1 of the Base Radio User Manual.

The Link Test measures the wireless link performance of a Transmitter running in its normal operating mode. Messages are sent from the Transmitter to the Base Radio at a predefined interval called the Transmit Rate (see Section 6.1). Each message contains data for the previous time period (since the last transmit). The Link Test looks at the wireless performance going in both directions, from the Transmitter to the Base Radio and vice versa, and comes up with a rating. The result that appears on the display shows the determined link strength.

In order to perform this test, the Transmitter must be communicating on the same channel and baud rate as the Base Radio. See Section 5 to configure communications.

The Link Test may only be conducted from Transmitters, Base Radios and WMT versions 1.7 and higher. However, a Link Test being run from WMT version 1.7 may test communications with Transmitters older than version 1.7.

The version number may only be checked when the Transmitter is powered up. See Figure 4.1.

### 3.2.2 Link Test

**NOTE**

The Link Test may only be conducted from Transmitters, Base Radios and WMT versions 1.7 and higher. However, a Link Test being run from WMT version 1.7 may test communications with Transmitters older than version 1.7.

The version number may only be checked when the Transmitter is powered up. See Figure 4.1.
Using the NEXT and ENTER buttons, navigate to Link Test, and press the ENTER button to begin the test. The Transmitter will begin to test the link in both directions (to and from the Base Radio). During this time, the word TEST will appear on the LCD display. When the test is complete, the Transmitter will display the quality of the link. Be aware that the Transmitter uses the configured Baud Rate and transmission rate to perform this test. The length of time it will take to perform this test is dependent upon how fast the device is normally transmitting.

When enough messages have been observed, a link strength will be shown on the display. >>>>>> indicates the strongest link, while > indicates the weakest link. The Link Test will continue to be evaluated and the rating on the screen may adjust itself. Keep in mind that the longer the Link Test runs the more data the Transmitter will have to evaluate.

The Transmitter installation site should strive to place the Transmitter in a location where it receives the highest number possible. A stronger link means less data re-transmits and better battery life.

When the Link Test is conducted from a Base Radio, it measures the link strength between a selected Transmitter and the Base Radio. The Link Test data must be configured to match the communication parameters of the Transmitter from which you want to test. The Link Test is located in the Base Radio’s diagnostic menu (see Figure 3.6).

To conduct a Link Test from the Base Radio, Navigate to Link Test, and press the Enter button. Next enter the RF ID for the Transmitter that you want to test. Then select the Normal Transmit rate that matches that of the Transmitter. If the Transmitter is transmitting at a different rate than the one you select in this menu, your results will be invalid.

Once the Normal Transmit Rate is selected, the Link Test will immediately start. The Base Radio will begin to test the link from the Transmitter. During this time, the word TEST will appear on the LCD display. When the test is complete, the Base Radio will display the quality of the link. Be aware that the length of time it takes to perform this test is dependent upon how fast the Transmitter is normally transmitting.
3.2.2.2 Continued

Figure 3.6: Menu Map to Base Radio Link Test

When enough messages have been observed, a link strength will be shown on the display. >>>>>> indicates the strongest link, while > indicates the weakest link. The Link Test will continue to be evaluated and the rating on the screen may adjust itself. Keep in mind that the longer the Link Test runs the more data the Transmitter will have to evaluate.

The Transmitter installation site should strive to place the Transmitter in a location where it receives the highest number possible. A stronger link means less data re-transmits and better battery life.

3.2.2.3: Conducting a Link Test from WMT

To conduct a Link Test from WMT, make sure that WMT is running on the PC attached to the Base Radio. Then go to the Transmitter view, and right-click on the Transmitter you want to test Received data transmission from (Figure 3.7).
Select **Wireless Data Loss Test...** from the popup menu.

The Wireless Data Loss Test window appears, see Figure 3.8. The name of the Transmitter being tested appears in the title bar in parenthesis.

![Figure 3.8: Wireless Data Loss Test](image-url)
3.2.2.3 Continued

In the top of the window, you can configure the test to run for a specified amount of time. The longer the test, the more data the test will have to do an evaluation. Type the length of time that you want to run the test and click Begin to start. After the test has completed, it will restore the previously configured Transmit Rate.

During the test, the communications reliability is evaluated while the Transmitter is running under normal operating conditions. As the test runs, a link strength will be shown in the lower right hand corner of the window. “>>>>>>” indicates the strongest link, while “>“ indicates the weakest link. The Link Test will continue to be evaluated and the rating on the screen may adjust itself for the specified amount of time.
3.3: Commissioning

In this section commissioning instructions are discussed for the various setup capabilities of the Differential Pressure Transmitter. The subsections are as follows:

3.3.1: Liquid Service Commissioning Using a 3-Valve Manifold
3.3.2: Liquid Service Zeroing Using a 3-Valve Manifold

Be careful when commissioning your transmitter. Transient pressure shock waves that can overpressurize the sensor causing zero shifts. These are most always generated on the upstream side of the instrument. By design, minimum zero shift is generated when the transmitter is over-pressured on the + side. Sensors are protected for overpressure on either side to the full pressure rating of the process flanges. However, stresses induced during overpressure will cause a temporary zero shift. It is therefore recommended that during commissioning and zeroing, every attempt should be made to prevent over-pressurizing the sensor on either side. The procedures outlined below will allow commissioning and zeroing without overpressurizing.

In the event that the sensor is subject to significant over-pressure, steps must be taken to re-establish the neutral instrument zero. If the sensor is or has been over-pressurized on the + side, any zero drift caused by the over-pressure will be negligible after a fairly short period of time – about three hours. If the sensor has suspected to have been over-pressurized on the - side, over-pressure equal to the static line pressure of the process should be applied to the + side and the zero allowed to neutralize for several hours.

3.3.1: Liquid Service Commissioning Using a 3-Valve

1. Check overall installation to ascertain that all fittings, plugs, vents and bolts are secure, leak free and ready for service.
2. All manifold and line shut-off valves, if installed, should be in the closed position.
3. Open manifold bypass valve and both line shut-off valves if installed. This will put a zero differential pressure across the sensor.
4. Slowly crack open the + Upstream manifold block valve until the sensor is at line pressure. Then fully open this + Upstream manifold block valve.
5. Crack open the + and - side vent plugs until all air is purged out of the transmitter and the manifold. Close the vents tightly.
6. Check ZERO output and adjust if necessary.
7. Open the - Downstream manifold block valve fully.
8. Close the manifold bypass valve. The sensor is now in service.

3.3.1: Liquid Service Zeroing Using a 3-Valve Manifold

Differential Pressure Sensors in flow service need to be periodically re-zeroed. The procedure for re-zeroing assumes that the sensor in service and that the line shut-off valves are open, that the + and - manifold valves are open and that the manifold bypass valve is closed. To then re-zero the transmitter use the following procedure:
1. Open the manifold bypass valve fully.
2. Close the - Downstream manifold block valve.
3. Check the zero output and adjust if necessary. If you suspect gas or air in the impulse lines, these should be purged.
4. Open the - Downstream manifold block valve.
5. Close the manifold bypass valve. The sensor is now in service.
This section discusses the generalities for configuring the Transmitter via the NEXT and ENTER buttons. The subsections are as follows:

4.1: Transmitter Displayed Messages
   4.1.1: The Read-Only Sequence
4.2: The Overall Configuration Menu Map
4.3: Setting a Transmitter Tag Name
4.4: Setting a User Password
4.5: Resetting All Transmitter Settings

4.1: Transmitter Displayed Messages

To turn the Transmitter on, press and hold both the NEXT and ENTER buttons for a few seconds. Upon power up, the Transmitter will display the Power-Up Sequence, and then go into the Operations Sequence. These Sequences are shown in Figure 4.1 below:

NOTE
During configuration and testing, keep Transmitters at least six feet from the Base Radio and other Transmitters to ensure good communications.

4.1.1: The Read-Only Sequence

Once the Transmitter is in the Operations Sequence, a user may access the READ-ONLY Sequence without a password by simply pressing the ENTER button at any time. The Read-Only Sequence, as shown in Figure 4.2, displays extra information about the current settings of the Transmitter that are not seen during the Operations Sequence, but does not allow any changes to be made to these settings.

Figure 4.1: Transmitter Power-UP and Operations LCD Sequences

Figure 4.2: The Read-Only Sequence
4.2: Overall Configuration Menu Map

A complete Transmitter Menu Map is shown in Appendix C. Below is an overall view of the configuration menu to aid the user in setting up the Transmitter for proper operation.

![Overall Configuration Menu Map](image)

NOTE
The user must enter a four digit password to enter the CONFIG and DIAGNSE. The FACTORY menu is for factory use only. The default user password is 0000. For more information on the password see Section 4.4.

4.3: Setting the Transmitter Tag Name

Each Transmitter has a user-settable Transmitter Tag Name. This Tag Name is displayed upon Transmitter power up, and when the Read-Only Sequence is selected. The Tag Name is a 21-character string that is displayed in three separate 7-character flashes on the Transmitter LCD.

The user may choose from A-Z, 0-9, a dash (“-“), and an underscore (“_“). The underscore has a special meaning to the software inside the Transmitter. For example, if you have a Tag Name that is only 5 characters long, then you do not want to wait for the rest of the 16 characters to be displayed on the LCD. So if your Tag Name was “TRAP1”, you would want to enter the Tag Name like this: “TRAP1 _ _ _ _ _ _ _ _”.

The Tag Name is entered via the Wireless Management Toolkit. To do so, when the software is in the Transmitter view (See Section 8.1 of the Wireless Management Toolkit User Manual), right-click the Transmitter icon, select Rename, then enter the Tag Name you wish the Transmitter to have.

This Tag Name will then be uploaded to the Transmitter and can be displayed by pressing the ENTER button when the unit is in the Operations Sequence (See Section 4.1.1 of this manual).
4.4: Setting a User Password

Each Transmitter has a password that will lock out undesired users from making changes to the Transmitter. Any user may still view some of the Transmitter settings by pressing the ENTER key during the Operations Sequence and viewing the Read-Only Sequence.

The password is a four-digit password. The factory default is 0000. If you wish to select a different password, one may be entered via the Wireless Management Toolkit software. To do so, enter the configuration menu (See Section 9.2 of the Wireless Management Toolkit User Manual). Once in the configuration menu, click on the General tab to display the general information as shown in Figure 4.4.

The Transmitter password for this device can be set by entering a four-digit number in the Transmitter Password field. Once a password has been entered, click OK to save and download the password to the Transmitter.

Please note that the password only protects the Transmitter from unauthorized configuration via the NEXT and ENTER buttons. The Wireless Management Toolkit requires a user login password to gain access to all configuration parameters. However, user accounts are available and can be set with different access levels and restrictions (For more information on user accounts see the Wireless Management Toolkit User Manual Section 8.4).

Figure 4.4: Setting a User Password

4.5: Resetting All Transmitter Settings

To reset all Transmitter settings to their default state, the user must navigate to the DEFAULT menu option in the CONFIG menu via the keypad.

Once at the default menu option, pressing the ENTER button will display ‘RESET?’ on the LCD; which asks if you are sure you want to reset the device to its default configuration. You will then be prompted with ‘NO’ on the LCD. Pressing the ENTER button while ‘NO’ is being displayed will NOT reset the device. Pressing the NEXT button will display ‘YES’ on the LCD. If you press the ENTER button while ‘YES’ is being displayed the device will be reset.

NOTE
Resetting the Transmitter by using the DEFAULT menu option will not reset the TRIM or OFFSET values.
Configuring the RF Communications

In order for the Transmitter and the Base Radio to communicate, they must be on the same RF Channel and must be transmitting at the same Baud Rate. While all Transmitters and Base Radios are set to default configurations at the factory, if any configuration differences are present, the Base Radio will not be able to communicate with the Transmitters. The subsections are as follows:

5.1: RF Channel Selection  
5.2: RF Baud Rate Selection  
5.3: RF Identification Selection

The RF Channel defines a set of frequencies on which communication takes place between the Base Radio and the Transmitter. Each RF Channel has a different set of frequencies, thus allowing the user to have multiple different wireless networks co-existing throughout the same facility.

All Base Radios and Transmitters can be set to one of 4 different RF channels. The only Transmitters recognized by a particular Base Radio are the units that are on the same RF Channel as that Base Radio. This allows the user to decide which Transmitters communicate with each Base Radio.

The RF Channel can be thought of as a set of walkie-talkies. If both walkie-talkies are on channel one they can communicate. If a walkie-talkie is on channel one and the other is on channel two, they cannot communicate. Likewise, if two walkie-talkies are on channel one and two other walkie-talkies are on channel two, the walkie-talkies on channel one cannot hear what is being transmitted by the walkie-talkies on channel two.

Each Transmitter comes from the factory with the RF Channel set to OFF. This means the Transmitter will not communicate to any Base Radio. To set the Transmitter for communication, first determine the channel that you want to use. Then follow the Transmitter menu map shown in Figure 5-1 to configure the RF Channel.

5.1: RF Channel Selection

Once in the RF Channel menu, increment it by pressing the NEXT button. When selecting this value, do not choose an RF Channel that is currently being used by other Honeywell Wireless Systems as this can cause communication problems.
5.2: Baud Rate

The RF Baud Rate refers to the speed at which the Base Radio and Transmitters communicate. The Baud Rate is not configurable. It is set at 4.8K. This allows the Transmitter to have a fastest update rate of 5 seconds and a range of 360m to 600m (1200 ft to 2000 ft) Line of Sight.

5.3: RF Identification (RF ID) Selection

Each Transmitter is identified by the Base Radio and WMT according to the RF ID given to that particular unit. Two Transmitters CANNOT have the same RF ID and be on the same RF Channel (if you do not know the RF Channel see section 5.1). If the Transmitter is in the Operations Sequence, pressing the ENTER button displays the Read-Only Sequence on the LCD. The RF ID of that unit will be displayed in this format: ID 3.

All Transmitters in your system are set to a default RF ID number upon shipment. For example, if you have ordered a Base Radio and three Transmitters, the Transmitters will be configured to RF ID’s 0, 0 and 0. You must set these units to three different IDs between 1 and 42. The Transmitters in this example could be set to RF IDs 1, 2 and 3.

First determine the RF ID’s you’d like to give each unit. Then follow the menu map shown in Figure 5.3 to configure the RF ID. The factory default is RF ID 0, which disables the RF communication of the unit.

Once you have selected the RF ID you wish to use for this particular Transmitter, exit the menus and return to the Operations Sequence.

The Transmitter should now be successfully configured to the Base Radio. To check this, press ENTER while the Transmitter is in the Operations Sequence for the Read-Only Sequence to be displayed. You may see an RF SYNC message displayed on the Transmitter LCD. This means that the Transmitter and Base Radio are attempting to synchronize communications. If this is successful the RF Status will display an RF OK message. If this is unsuccessful the RF Status will display a NO RF message.

Also notice the two small arrows on either side of the LCD; if they are fluctuating up and down, that indicates the Transmitter and Base Radio are successfully communicating. If only one or none of the arrows are moving then RF communication is unsuccessful.
Configuring the Sampling and Transmission Rates

The Differential Pressure Transmitter is very versatile with many programmable features and can be used in numerous different applications. Because no two applications are the same, some configuration is required for each unit. This section will walk you through the initial configuration of these sample and transmit settings. The subsections are as follows:

- 6.1: Selecting the Normal Transmission Rate
- 6.2: Selecting the Normal Sampling Rate
- 6.3: Selecting the Abnormal Transmission Rate
- 6.4: Selecting the Abnormal Sampling Rate
- 6.5: Setting the Smart Rate Threshold
- 6.6: Selecting the Normal Upper and Lower Values
- 6.7: Selecting Rates, Thresholds, and Deadbands via the Software

### 6.1: Selecting the Normal Transmission Rate

The Normal Transmission Rate is the interval in which the Transmitter transmits data to the Base Radio. The Transmitter is in a “sleep” mode to save power during the operations sequence. This mode turns off most of the electronics on the unit, with the exception of the LCD, in order to preserve battery life. The Transmitter will then ‘wake up’ every Normal Sampling Period and take the necessary process value readings. The Transmitter will then transmit these readings to the Base Radio on an interval determined by the Normal Transmission Rate.

In order to properly set the Normal Transmission Rate, you must first determine how often you need updates from the Transmitter. You have a selectable range of 5, 10, 15, 20, 40 seconds and 1 minute. The factory default is 10 seconds.

If all of the data does not get through, the data is resent the following second. This prevents data from being lost.

The Wireless Management Toolkit software can be used to configure this setting. An explanation of how to select the Normal Transmission Rate using the Wireless Management Toolkit software can be found in Section 6.6 of this manual.

![Figure 6.1: Menu Map to Normal Transmission Rate Setting](image)
6.2: Selecting the Normal Sampling Rate

The Normal Sampling Rate is the interval in which the Transmitter reads the monitored process value. As previously mentioned, the Transmitter is in “sleep” mode to save power during the operations sequence. This mode turns off most of the electronics on the unit (with the exception of the LCD) in order to preserve battery life. The Transmitter will then ‘wake up’ for every Normal Sampling Period and take the necessary process value readings.

Notice that the minimum speed of the Normal Sampling Rate is dependent on the Normal Transmission Rate setting selected (see Section 6.1). The Sampling Rate cannot be set slower than the Normal Sampling Rate. Thus, if you selected the Normal Transmit Rate setting to be 10 Seconds the Normal Sampling Rate must be set to 10 Seconds or faster. A complete table of these parameters is shown below.

In order to properly set the Normal Sampling Rate determine how often updates are needed from the Transmitter when the process being monitored is operating under normal conditions. The Transmitter has a selectable range of 1-5, 10, 15, 20, 30, and 60 seconds depending on the Normal Transmission Rate. The factory default is 1 second. However, the more frequently the Transmitter wakes up to check the monitored device, the faster you will use up the battery life of the Transmitter.

Figure 6.1 is an example of what happens when the Normal Sampling Rate is too slow for the process being monitored. Notice how the rise in the voltage level falls between two normal samples, and thus goes completely undetected.

Figure 6.3 is an example of what happens when the Normal Sampling Rate is correctly set for the device that is being monitored. Notice how this setting makes it possible to sample the rise in the voltage level.

The Wireless Management Toolkit software can be used to configure this setting. An explanation of how to select the Normal Sampling Rate using the Wireless Management Toolkit software can be found in section 6.6 of this manual.

6.3: Selecting the Abnormal Transmission Rate

NOTE
If the device is not configured to check for abnormal process conditions using Sample Bands (section 6.6), the Abnormal Transmission rate is not used and this section can be ignored.

The Abnormal Transmission Rate is identical to the Normal Transmission Rate with one exception. The Abnormal Transmission Rate only applies while the Transmitter is in an abnormal condition (see Section 6.6). This allows an increase or decrease in the frequency of information you receive depending on the operating conditions of the process being monitored.

In order to properly set the Abnormal Transmission Rate, determine how often updates are needed from the Transmitter when the process being monitored is operating under normal conditions. The Transmitter has a selectable range of 5, 10, 15, 20, 40 seconds and 1 minute. Figure 6.3 is an example of how the device switches transmission rates from Normal Transmission Rate to Abnormal Transmission Rate. Note how the first abnormal transmission is sent immediately when the Normal Upper Value set point is exceeded. The next transmission will then follow this immediate transmission by 10 seconds (or whatever the Abnormal Transmission Rate is set to). The transmissions will continue at this interval until the process value drops below the Normal Upper Value set point.

Once the process value drops below this set point, another transmission is sent to the Base Radio. The transmissions will then be sent at the Normal Transmission Rate of one minute (the current setting for the Normal Transmission Rate) from the time of the last abnormal transmission.

The user should also note that the transmission time depends on the sampling rate, and when the process value is sampled. If the Normal Sampling Rate is 30 seconds, then the process value may be above the Normal Upper Value for up to 29 seconds before an abnormal condition is detected. This means that the transmission could be as late as 29 seconds after the process value exceeded the Normal Upper Value.

The Wireless Management Toolkit software can be used to configure this setting. An explanation of how to select the Abnormal Transmission Rate using the Wireless Management Toolkit software can be found in section 6.6 of this manual.

Figure 6.5: Example of Abnormal Transmission Rate Setting

![Figure 6.5: Example of Abnormal Transmission Rate Setting](image)

Figure 6.6: Menu Map to Abnormal Transmission Rate Setting

![Figure 6.6: Menu Map to Abnormal Transmission Rate Setting](image)
6.4: Selecting the Abnormal Sampling Rate

The Abnormal Sampling Rate is identical to the Normal Sampling Rate with one exception. The Abnormal Sampling Rate only applies while the Transmitter is in an abnormal condition (see 6.6 Selecting the Normal Upper and Lower Values). This allows an increase or decrease of the frequency of information you receive depending on the operating conditions of the process being monitored.

In order to properly set the Abnormal Sampling Rate, determine how often updates are needed from the Transmitter when the process being monitored is operating under normal conditions. The Transmitter has a selectable range of 1-5, 10, 15, 20, 40 seconds and 1 minute. Figure 6.7 is an example of how the device switches sampling methods from Normal Sampling Rates to Abnormal Sampling Rates. Note how the first abnormal sample is taken a few seconds after the Normal Upper Value set point is exceeded. The next sample will then follow this sample by 5 seconds (or whatever the Abnormal Sampling Rate is set to). These samples will continue at this interval until the process value drops below the Normal Upper Value set point.

Once the process value drops below this set point the sampling rate will return to the Normal Sampling Rate. Also, the Abnormal Sampling must be equal to or faster than the Abnormal Transmission Rate.

The user should also note that the transmission time depends on the sample rate, and when the process variable is sampled. If the Normal Sampling Rate is 30 seconds, then the process variable may be above the Normal Upper Value for up to 29 seconds before abnormal condition is detected. This means that the transmission could be as late as 29 seconds after the process variable exceeded the Normal Upper Value.

The Wireless Management Toolkit software can be used to configure this setting. An explanation of how to select the Abnormal Sampling Rate using the Wireless Management Toolkit software can be found in section 6.6 of this manual.

![Figure 6.7: Example of Abnormal Sampling Rate Setting](image)

![Figure 6.8: Menu Map to Abnormal Sampling Rate Setting](image)
The Smart Rate is a feature used to trigger radio transmission of the measured data sooner than the normal or abnormal rate specified by the user. This feature is used to construct a more accurate graph of the measured process value vs. time than is possible with the fixed transmission rates, while using less battery power.

First you must decide the amount that the process variable must change since the last data sample to trigger a new transmission of the process value.

If the process value changes by more than the entered Smart Rate amount within the normal or abnormal sampling rate (whichever is active), then the process variable is transmitted immediately. The normal/abnormal transmit clock is then reset upon this transmission. If no Smart Rate amount exceeding change takes place in the next normal/abnormal sample, then the next transmission will be the normal/abnormal transmit rate period.

The amount entered is in the same units as were selected by the user to be displayed on the Transmitter. If the measured process value does not change by more than the entered Smart Rate amount within the time between the sampling rates (whichever is active), then the process value is transmitted on the next transmit rate.

If changes in the process value, which exceed the Smart Rate Amount, continue to occur, the process value is transmitted repeatedly.

To configure the Smart Rate using the Wireless Management Toolkit software, enter the configuration menu (See Section 9.2 of the Wireless Management Toolkit User Manual). Once in the configuration menu click on the Sampling Rates tab to bring up the sampling rate information as shown in Figure 6.9.

To enable the Smart Rate, click the check box labeled Enable SmartRate. The user will then be allowed to enter a “delta”, or amount changed, value which will trigger a transmission.

Once a value has been entered, click OK to save and download the configuration changes to the Transmitter.
6.6: Selecting the Normal Upper and Lower Values*

Each Transmitter is equipped with an analog input level upper and lower value. As the analog input is measured, it is compared to a set threshold value. Depending upon the setting of that value, whether it is enabled or not, and what the Time Deadband is, the Transmitter will enter an Abnormal condition as seen in Figure 6.10.

The Normal Upper Value would be an indication that the analog input is ‘high’ and the Normal Lower Value would be an indication that analog input is ‘low’. Thus the normal operating condition for the analog input application would be found in between the two Normal Values.

The Time Deadband refers to the number of seconds that the measured reading must stay in a certain condition before the Transmitter will actually switch to that condition. To select a proper Time Deadband consider the example in Figure 6.12.

Notice that the Transmitter continues to cycle from Normal to Abnormal Conditions due to the fact that the input value is fluctuating around the 7.5 Volt Normal Upper Value. This is undesired. The addition of a few second delay before the Transmitter switches conditions will eliminate this “chatter”, as seen in Figure 6.13.

Using Wireless Management Toolkit

If you have the Wireless Management Toolkit software this menu option will not be accessible via the Transmitter once the Transmitter detects that the software is being used (See Appendix A for more details). An explanation of how to select the Abnormal Sampling Rate using the Wireless Management Toolkit software can be found in section 6.7.

* Indicates that Menu is Disabled if Wireless Management Toolkit is detected. (See Appendix A)
6.7: Selecting Rates, Thresholds, and Deadbands via the WMT

To configure the Normal and Abnormal Sampling and Transmission menu options using the Wireless Management Toolkit software, enter the configuration menu (See Section 9.2 of the Wireless Management Toolkit User Manual). Once in the configuration menu click on the Sampling Rates tab to bring up the sampling rate information, as shown in Figure 6.14.

To select the Normal Transmission Rate, select one of the time periods from the drop box. Next, select an Abnormal Transmission Rate in the same manner. Note that the Normal and Abnormal Transmission Rate can be the same.

Once the transmission rates have been selected, the user should select the desired sampling rates. Note that the sampling rate must be equal to or faster than the associated transmit rate. For example, in Figure 6.14 the Normal Transmission Rate is set to 10 seconds and the Normal Sampling Rate is set to 1 second. This is a valid configuration.

If the user incorrectly enters the Transmission and Sampling Rates, a message will be displayed explaining this to the user. The user will not be allowed to leave this screen before the setting is corrected.

To configure the Normal Upper and Lower Value menu options using the Wireless Management Toolkit software, enter the configuration menu (See Section 9.2 of the Wireless Management Toolkit User Manual). Once in the configuration menu click on the Sampling Bands tab to bring up the sampling band information as shown in Figure 6.15.

To set a limit to the normal condition, enable the limit by clicking on the Use Input 1 Limit check box. Then enter the value and time deadband for the limit.
Section 7

Configuring the Process Variable

This section helps the user in the selection of engineering units, as well as discussing the setting of a measurement offset and trimming the process measurement. The subsections are as follows:

7.1: Selecting Units of Measure
7.2: Zeroing the Sensor
7.3: Setting a Measurement Offset
7.4 Trimming the Measurement
7.5: Entering a 22-Point Curve

7.1: Selecting Units of Measure

The Transmitter can be used in many different types of applications. To accommodate these various options, there are various engineering units that can be selected.

To select units of measurement, follow the Transmitter menu map shown in Figure 7.1. The units are listed on the left. The factory default is PSI

<table>
<thead>

</tr>
</tbody>
</table>

If you have the Wireless Management Toolkit software this menu option will not be accessible via the Transmitter once the Transmitter detects that the software is being used (See Appendix A for more details). The process variable units should be entered using the Wireless Management Toolkit software. To do so, enter the configuration menu (See Section 9.2 of the Wireless Management Toolkit User Manual). Once in the configuration menu click on the General tab to bring up the general information as shown in Figure 7.2.

To select the units, click the drop down box labeled Input Units. Select units you wish to use from the available list.

Once a valued has been entered, click OK to save and download the configuration changes to the Transmitter.
7.2: Zeroing the Sensor

Zeroing the sensor can only be performed from the Transmitter. You will need to check the “position zero” reading on the transmitter. The Differential Pressure Transmitter is a sensitive device. Its elevation and its orientation in the field may be different from the orientation in the factory where it received its last configuration. To compensate for position changes, you may need to perform a sensor position adjustment once the unit is installed.

For this step, power the unit and apply zero pressure. Be sure that the unit is installed in its final location or that it is oriented exactly as it will be in its final installation. If you have a differential pressure device, you will also need to go through a series of operations to fill the impulse lines to the device (See Section 3.3: Commissioning).

If you have a transmitter pressure reading of “zero”, (that is, the transmitter reading is within the specified accuracy of ±0.07% of the full scale value when zero pressure is applied), there is no need to zero the sensor. If your “zero” reading is outside of this value, you will need to execute the position zero adjustment by following the menu map shown in Figure 7.3.

When P ZERO is selected, the sensor is zeroed. However, the displayed value is calculated relative to the offset point. The unit will display an amount equal to the keypad-configured offset added to the WMT-configured level offset, if applicable. If the intent is to have the unit display “0,” the offsets must be zero before applying P ZERO.

For example, if 3 PSI of pressure is applied to a sensor, an offset of 5 PSI is entered into the keypad, and P ZERO is applied, the unit will display 5 PSI. If the pressure is then raised by 1 PSI to 4 PSI, the unit will display 6 PSI.

Figure 7.3: Menu Map to Pressure Zero Setting
7.3: Setting a Measurement Offset

For various applications, the user may wish to display an offset value rather than the actual value. To enter an offset, navigate to the OFFSET command, as shown in Figure 7.4. Then enter the offset to be added or subtracted from the actual measured value.

7.4: Trimming the Measurement

The Transmitter interface allows you to set a two-point correction curve for the sensor. This process is often called “trimming” because the displayed value is trimmed up or down to reflect the actual value being applied.

To set a trim point, take the Transmitter offline and navigate to the TRIM menu, as shown in Figure 7.5, and select the input to be trimmed. Then select the point you wish to enter. After selecting the point, you will have the option to trim the device or reset the trim. If NEW TRIM is selected, you will be prompted to enter the lower point first. Type the value and press ENTER. The Transmitter will prompt you to apply the indicated process value to the Transmitter. Apply the process value and press ENTER. Repeat the process for the higher point. After both points have been trimmed, you can choose to save or discard the new trim.
**7.5: Entering a 22-Point Curve**

If you are running WMT, a 22-point sensor offset curve may be entered for the Transmitter. To do so, open the configuration dialog box. Once in the configuration dialog box, click the Sensor Offset tab to bring up the offset information as shown for Level in Figure 7.6.

*Figure 7.6: Setting a 22-Point Curve Using WMT*
Selecting and Configuring Operation Modes

In this section the four operation modes: differential pressure, orifice flow, open channel flow, and level are discussed in order to aid the user in selecting the right mode for his or her application and properly configuring the Transmitter for that specific application. The subsections are as follows:

8.1: Differential Pressure
8.2: Orifice Flow
8.3: Open Channel Flow

8.1: Differential Pressure

This mode simply calculates and displays the differential pressure value from the Differential Pressure sensor. To set the Transmitter to this operation mode, you must go to the configuration menu of the Transmitter via the Software. For further instructions on getting to the configuration menu see Section 9.2 of the Wireless Management Toolkit User Manual.

Once you have opened the configuration menu, select the Operation Mode tab at the top of the menu. You should then see a menu like the one shown in Figure 8.1.

To select the Differential Pressure mode, select Pressure in the Mode drop down box. This will display another drop down box which will allow the selection of differential pressure engineering units. You should select the units that are appropriate for your application. All possible units are listed below:

<table>
<thead>
<tr>

Once engineering units have been selected, a 22-point sensor offset curve can be enabled (it is disabled upon delivery from the factory) by selecting the Sensor Offset tab within the configuration menu.
8.2: Orifice Flow

In this mode, the user has the option of setting up volumetric or mass flow calculations through an orifice plate, if the density units are selected and entered mass flow calculations are available. The user must enter a differential pressure value and a flow value corresponding to the pressure value. Using these two points, the PC will calculate the flow value that corresponds to the full-scale pressure value of the Transmitter (i.e., FS Flow). Finally, the user also must enter a truncation point value. This information is used to calculate flow in the units selected by the user.

To set the Transmitter to this operation mode, you must go to the configuration menu of the Transmitter via the Software. For further instructions on getting to the configuration menu see Section 9.2 of the Wireless Management Toolkit User Manual.

Once you have opened the configuration menu, select the **Operation Mode** tab at the top of the menu and select **Orifice Flow** from the mode menu. You should then see a menu like the one shown in Figure 8.2.

Select the units that are appropriate for your application. All possible units are listed below:

<table>
<thead>
<tr>

* Starred units are only available once the Density check box has been selected.
8.2: Orifice Flow (cont.)

NOTE
** Percent Volume Flow may only be selected from the Flow Units list. It does not appear in the Flow list. Selecting Percent Volume Flow enables the Square Root Function. See section 8.2.1 for more information.

8.2.1: Square Root Calculation

Once engineering units have been selected, a 22-point sensor offset curve can be enabled (it is disabled upon delivery from the factory) by selecting the Sensor Offset tab within the configuration menu.

When the Transmitter is in Orifice mode, a Square Root calculation is performed. You have the option to display the Square Root Calculation. If this option is enabled, it will be displayed as Percent Square Root in WMT and sent to a ModBus Register.

To display the Square Root Calculation, first make sure you have selected Orifice Flow from the mode menu. Then, from the Flow Units drop-down list, select Percent - Vol Flow. If the Density check box is selected, then Percent - Mass Flow can also be selected from the Flow Units drop-down list to show the Square Root Calculation.

** Figure 8.3: Orifice Flow with Square Root Calculation Enabled **

---

User Manual  Rev. 6  July 2012
8.3: Open Channel Flow

This mode lets the user setup flow calculations for open channel flow measurements for weirs. In order to make this calculation, the user must enter the density of the material, a differential pressure value and a matching flow value. In addition, a truncation point value must be entered. Finally, the user must fill out the 22-point curve table indicating the relationship between column height and flow rate.

To set the Transmitter to this operation mode, you must go to the configuration menu of the Transmitter via the Software. For further instructions on getting to the configuration menu see Section 9.2 of the Wireless Management Toolkit User Manual.

Once you have opened the configuration menu, select the Operation Mode tab at the top of the menu and select Open Channel Flow from the mode menu. You should then see a menu like the one shown in Figure 8.3.

Select the units that are appropriate for your application. All possible units are listed below:

<table>
<thead>
<tr>
<th>Open Channel Flow</th>
<th>Display Characters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Barrels / Day</td>

Once engineering units have been selected, a 22-point sensor offset curve **must** be enabled (it is disabled upon delivery from the factory) by selecting the **Sensor Offset** tab within the configuration menu.
In this mode, the user has the option of entering the density of material or the full tank pressure. Also, the user must enter tank height and tank volume. Finally, the user must select level units, which can be in units of height, volume, or mass. The entered information is used to make level calculations in the units selected by the user. For non-uniform tanks, the user must also fill out the 22-point curve table indicating the relationship between height and volume.

To set the Transmitter to this operation mode, you must go to the configuration menu of the Transmitter via the Software. For further instructions on getting to the configuration menu see Section 9.2 of the Wireless Management Toolkit User Manual.

Once you have opened the configuration menu, select the **Operation Mode** tab at the top of the menu and select **Fluid Level** from the mode menu. You should then see a menu like the one shown in Figure 8.4.

![Figure 8.5: Level Mode](image)

**NOTE**

For Level, a 22-point curve table must be filled out for correct operation.

Once engineering units have been selected, a 22-point sensor offset curve must be enabled (it is disabled upon delivery from the factory) by selecting the **Sensor Offset** tab within the configuration menu.
Maintaining the Transmitter

The Differential Pressure Transmitter is extremely easy to maintain in that it requires no periodic calibration or system checks. The Transmitter has a self-diagnostic that is constantly checking the internal system. If any errors are found they are reported via the LCD, Base Radio or in the WMT. A simple yearly visual inspection for the following is all that is needed:

- Is the Transmitter still securely fastened to the equipment being monitored?
- Are there any visible corrosions, cracks or residue build-ups on the unit?
- Has anything about the application changed from the original intended use?

9.1: Changing the Battery

The battery will need to be changed within one month of seeing a ‘LOW BAT’ message on the Transmitter. This is a simple process:

1. Make sure you have the correct replacement battery:
   - Lithium Inorganic Battery (non-rechargeable)
   - Size “C” – 3.6Volts
   - Tadiran TL-2200
   - Tadiran TL-5920
   - Tadiran GmbH SL-2770

2. Power down the Transmitter by pressing and holding both the NEXT and ENTER buttons for a few moments.

3. Remove the 4 set screws on the sides of the Transmitter housing with a standard screw driver.

4. Remove the housing and locate the battery. Warning! When removing the housing do not twist or bend the green flex cable! Doing so may cause the tether to improperly seat next to the antenna and greatly reduce operable RF distances. Do not allow the housing to flop around while hanging by the tether.

5. Remove the old battery and replace it with the new battery positive end first. **(Note that the positive end of the battery clip is the end with the red wire).**

6. Plug the green wire flex cable back in if unplugged and replace the housing. Then, screw the housing back on, and power up the unit by pressing either of the buttons.

7. Properly dispose of used battery.

</tbody>
</table>

Output Resolution
- See the Base Radio description for analog and digital output options
Operating Temperature Range
- -40°F to +220°F (-40°C to +104°C) process connection temperature, steady state
- -40°F to +185°F (-40°C to +85°C) electronics except ATEX certified applications -40°F to +149°F (-40°C to +65°C)
- -4°F to +158°F (-20°C to +70°C) display (full visibility) except ATEX certified applications -40°F to +149°F (-40°C to +65°C)
- -40°F to +185°F (-40°C to +85°C) display (with reduced visibility) except ATEX certified applications -40°F to +149°F (-40°C to +65°C)
- Humidity Limits: 0 to 100%

Sampling and Transmission Characteristics
The Differential Pressure Transmitter samples differential pressure or flow at regular intervals. The data may then be transmitted to the Base Radio for centralized monitoring and data acquisition. The user specifies how frequently the process is monitored and how often data is transmitted.
- Differential Pressure/Flow – user designates low rate and high rate conditions
- Sampling rate – user selectable from 1 to 60 seconds (low rate) and from 1 to 30 seconds (high rate)
- Transmission rate – user selectable from 1 second to 60 seconds (low and high rate)

Power Characteristics
- Self-contained power
- ‘C’ Size 3.6 V lithium battery
- Up to five year battery life (depends on sample rate and RF update rate), field replaceable

RF Characteristics
- 869.4 MHz – 869.65 MHz Frequency Hopping Spread Spectrum (FHSS)
- Up to 600 m (2000 ft) range from Base Radio with clear line of sight; 150 m to 300 m (500 ft to 1000 ft) range with obstructions
- The RF module in each transmitter is individually tested and calibrated over the full temperature range to ensure reliable wireless operation

Self-Diagnostics
Low battery alarm – indicates the need to replace the battery (approximately one month warning)
- Contains extensive self-checking software and hardware that continuously monitors the operation. Any sensor or device parameter out of spec is identified and reported

Materials of Construction
- Type 316 stainless steel base
- Type 316 stainless steel diaphragm
- Type 316 stainless steel and bolts
- DC 200 silicone sensor filling fluid
- Weight approximately 3.7 kgs (8.1 lbs)
- Lexan® cover. V-0 rating and UV stable

Operating Vibration and Shock Characteristics
- Certified per IEC 60068-2-6 (vibration) and 2-27 (shock)

Random Vibration Characteristics
- Certified to withstand 6 g’s, 15 minutes per axis from 9 – 500 Hz
CE Conformity

- These models are in conformity with the protection requirements of European Council Directives: 89/336/EEC, the EMC Directive, and 1999/5/EC, the Telecommunications Directive in accordance with EN 300 220-3-2000, EN 300 489-1-2005, EN 300 489-3-2002, and EN 61326-1997+A1+A2. Conformity of this product with any other “CE Mark” Directive(s) shall not be assumed.

ATEX Certifications

- Intrinsically Safe, Zone 0/1: Ex II 1 G EEx ia IIC T4 (Ta = -40°C to +65°C) IP65
- Non-Sparking, Zone 2: Ex II 3 G EEx nA, IIC T6 (Ta = -40°C to +85°C) IP65

Configuration

The Wireless Management Toolkit is required for initial set-up and ongoing configuration. Options include a 22-point custom curve capability.

The Wireless Management Toolkit can also be used for monitoring of the process information. The user can set thresholds to represent “alarm” or abnormal conditions.

A local display provides:

- Integrated LCD display with membrane switch buttons
- Display provides pressure reading and error messages, if applicable
- Configure RF parameters locally using membrane switch buttons

Navigating User Menus

Pressing either the NEXT or ENTER buttons located on the front of the Transmitter or Base Radio just below the Liquid Crystal Display (LCD) screen is all that is needed to navigate the respective menus. Pressing both of these buttons for one second will turn the unit on.

Pressing the NEXT button at any time while the Transmitter is cycling through the normal messages causes the Transmitter to enter the setup mode. The NEXT button is then used to step through menu options, and the ENTER button is used to enter a sub menu of what is displayed on the LCD at that time. If no button is pressed within a 30 second period the unit goes back to the normal display mode.

If you enter a sub menu that requires a numerical input, such as 001, the left most 0 will be blinking. This indicates that pressing the NEXT button will increment this value with each press from 0 to 9 and back to 0 again. Pressing the ENTER button will move to the next available value. If the last value is blinking, pressing ENTER will save the entered values and return from the sub menu.

If both the NEXT and ENTER buttons are depressed at once, a message on the LCD displaying OFF? will appear. If both buttons are released upon appearance of this message the user will be returned to the scrolling main screen. If both buttons are not released for the duration of the OFF? message the unit will power down and turn off. Note: If the unit is turned off while entering values in a sub menu, those values will NOT be saved.

* As shown throughout the document, this mark indicates that these menu options will automatically turn off if the Wireless Management Toolkit Software is used. All changes to these Transmitter menu options should be made through software instead. This is to prevent simultaneous changes from taking place. If you wish to discontinue use of the software and want these menus re-instated, you must contact your Honeywell Sales Representative.
Transmitter Displayed Message Definitions

This section covers the various messages, displayed on the Transmitter LCD, that occur during operation of the device.

Operations Sequence

- **RF Link Status**
  - RF OK – Transmitter and Base Radio are communicating properly
  - RF SYNC - Transmitter and Base Radio are attempting to synchronize communications.
  - RF OFF - Transmitter’s RF Channel is set to RF OFF
  - NO RF - Transmitter and Base Radio have no communications

- **Differential Pressure Input Level**
  - –XX.XX – Currently measured differential input level

Error Messages

If an error is detected with the operation of the Transmitter a message will be displayed on the Transmitter LCD (a corresponding message may also appear on the Base Radio LCD).

There are few types of error messages, warning and fatal. Warning messages are displayed as part of the normal cycling message sequence. These are:

- **LOW BAT** - battery should be replaced as soon as possible
- **NO RF** - can not detect Base Radio
- **S FAULT** - there is an open sensor or excitation wire detected. Also if a sensor value goes above/below logical limits. The unit will display 9999.99 for measurement (sensor fault mode); but will continue sampling and recover if the problem desists.
- **OVERRNG** - the device is measuring a value above/below sensor dependent bound values. For example the Analog Input device will report over-range if measurement is above 105% range of the Analog Input sensor. If the measurement goes above 150% full range, the unit will go into Sensor Fault mode. In over-range mode, the measurement is continued to be displayed, with the "OVERRNG" message to remind the user that the specified range of the sensor and the calibrated range of the device is being exceeded.

Fatal error messages will replace the normal cycling message sequence and will flash. A fatal message indicates the Transmitter is no longer operating normally and requires repair. These are:

- **RF ERR** - fatal error within RF communications
- **SEN ERR** - fatal error within the sensor electronics
- **SYS ERR** - fatal error within the microprocessor system
- **RF CAL** - fatal error within the RF calibration system
